

EXHIBIT E-3.34(b)

TRUE-SOURCE DEPENDENCY ASSESSMENT (TSDA) Methodology Amendment - Version 1.1

Researcher: Blessing Ameh | Effective date: October 1, 2026

Applies to	Exhibit E-3.34(a), TSDA Methodology and Data Specification, Version 1.0, dated September 30, 2026
Section amended	6.4 - No Diversification
Purpose	Align the classification language with the robustness rule already stated in Section 5 after the initial gallium application exposed a specification gap.

1. Prior Version 1.0 Wording

Section 6.4 - No Diversification: "Direct U.S. supplier concentration does not decline under the principal and sensitivity specifications."

2. Amended Version 1.1 Wording

Section 6.4 - No Diversification: "Direct U.S. supplier concentration does not show a robust decline under Section 5."

3. Reason for Amendment

The initial gallium application produced a result not expressly covered by the Version 1.0 wording. The principal pooled direct-supplier HHI increased from 1,557.5 in 2019-2022 to 2,416.9 in 2023-2025, while the simple average of annual HHIs declined slightly from 2,807.5 to 2,641.0 and the annual series remained volatile. The prior wording could therefore imply that the No Diversification classification was unavailable whenever any sensitivity measure declined, even though Section 5 already requires a decline to be robust before it is treated as established.

4. Effect of Amendment

Version 1.1 makes Section 6.4 follow the existing Section 5 robustness standard. A No Diversification classification is appropriate when the evidence does not establish a robust decline in direct-supplier concentration. The amendment does not alter the data, the pooled-period specification, the HHI formula, the intermediary-tracing rules, or the definitions of Genuine Reduction, Partial Reduction, Apparent Diversification, or Unresolved.

5. Application to the Gallium Case

Under Version 1.1, the gallium direct-supplier result is classified as **No Diversification** because the principal pooled HHI rises materially and the annual sensitivity pattern does not establish a sustained or robust decline. This classification is separate from the true-source attribution analysis and from the Section 8 disruption-validation test.

6. Version-Control Statement

The original Version 1.0 methodology remains preserved as Exhibit E-3.34(a). This one-page amendment is issued before preparation of the final gallium results exhibit and should be read together with Version 1.0. Future references to Section 6.4 use the Version 1.1 wording above.

Research record note: The amendment was prompted by the first empirical application of the pre-specified method. The change narrows a classification ambiguity; it does not change observed outcomes after seeing them in order to force a preferred result.
